

Operating Systems - Process Scheduling Notes

Introduction: Process scheduling is a fundamental OS function that decides which process runs at a given time.

Types of Scheduling: Long-term, Short-term, and Medium-term scheduling.

Scheduling Algorithms: FCFS, SJF, Round Robin, Priority Scheduling.

FCFS: First Come First Serve, simple but can cause long waiting times.

SJF: Shortest Job First, optimal but hard to predict burst time.

Round Robin: Time-sharing system using time quantum.

Priority Scheduling: Processes are scheduled based on priority.

Key Concepts: Waiting time, Turnaround time, Response time.

Conclusion: Efficient scheduling improves CPU utilization and system performance.
